STUDYFLOW

Screens and user workflow

A visual review of the Android application

Report 02 / Version 1.0.0+1 / November 4, 2026

This report presents StudyFlow's main screens and essential workflow. Images show the real Flutter interface running in an Android emulator. The plan screens use demonstration data with three courses, four tasks and focus minutes from the last seven days.

Screenshot scope
Demonstration data is held in a separate study_flow_report_en box. Account, loading and error screens use a controlled test service. These images do not prove real account creation or cloud writes. Existing user records and private account details are not included.

Workflow	Screen
Review the plan	Overview and Tasks
Create a task	New task form
Track study time	Focus and Progress
Change language	Turkish / English
Connect an account	Sign-in and registration
Understand the result	Loading and error feedback
Check the calendar	Public holidays in Türkiye

Overview and task list

Overview displays daily focus time, pending tasks and courses. Tasks sorts pending work by due date and marks overdue items with colored text.

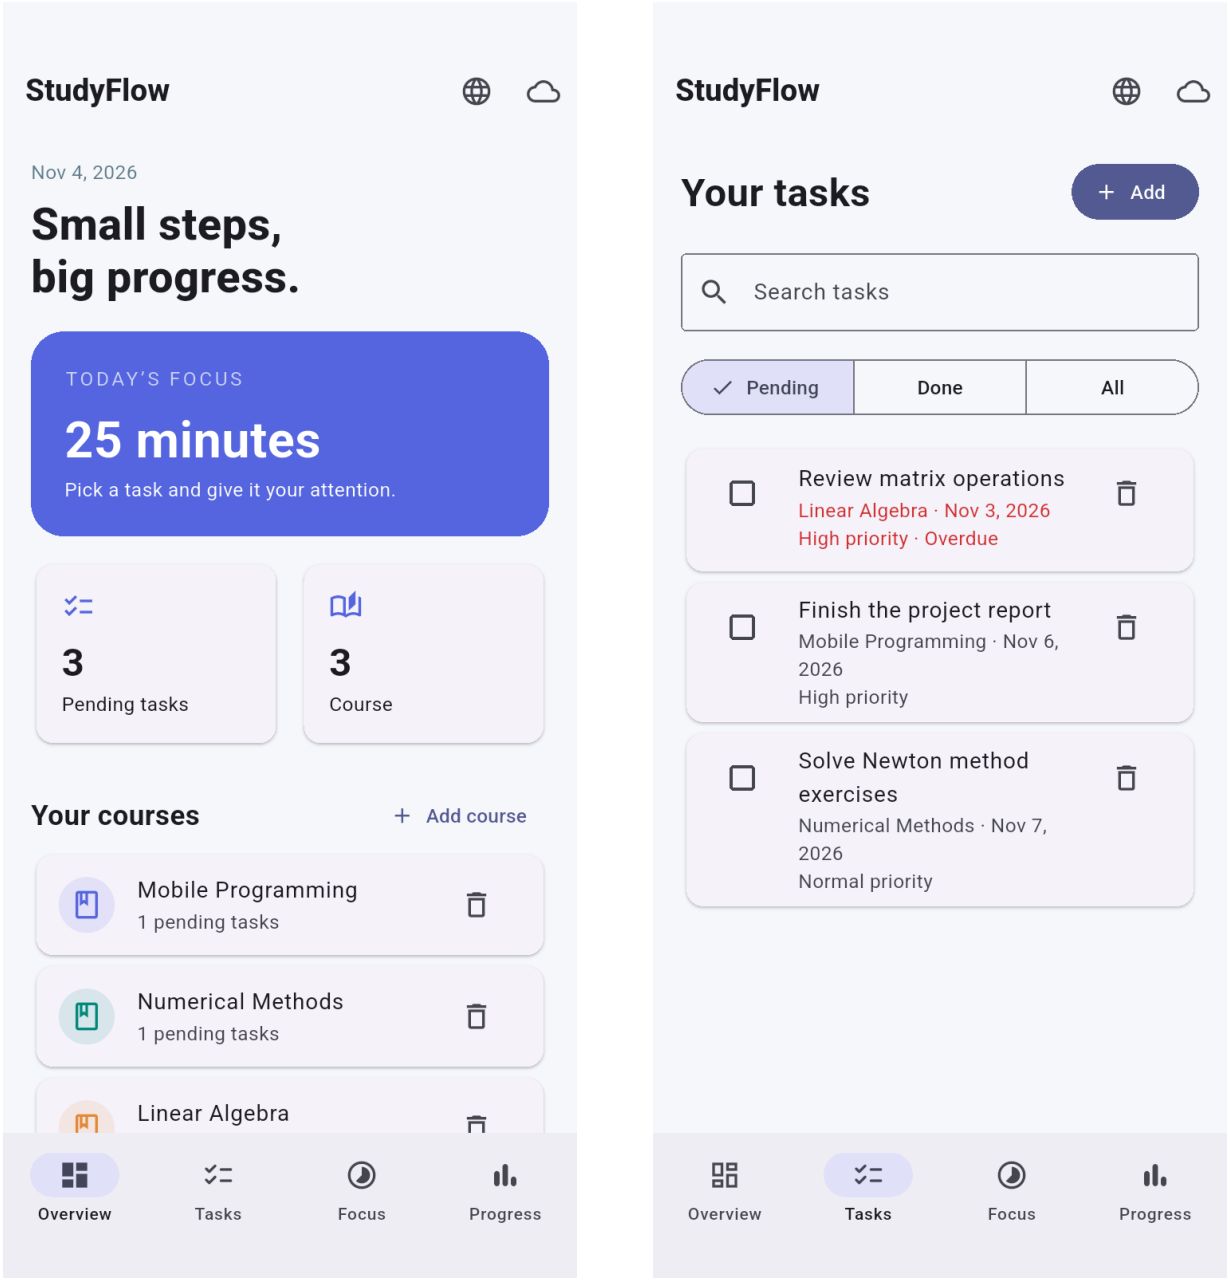

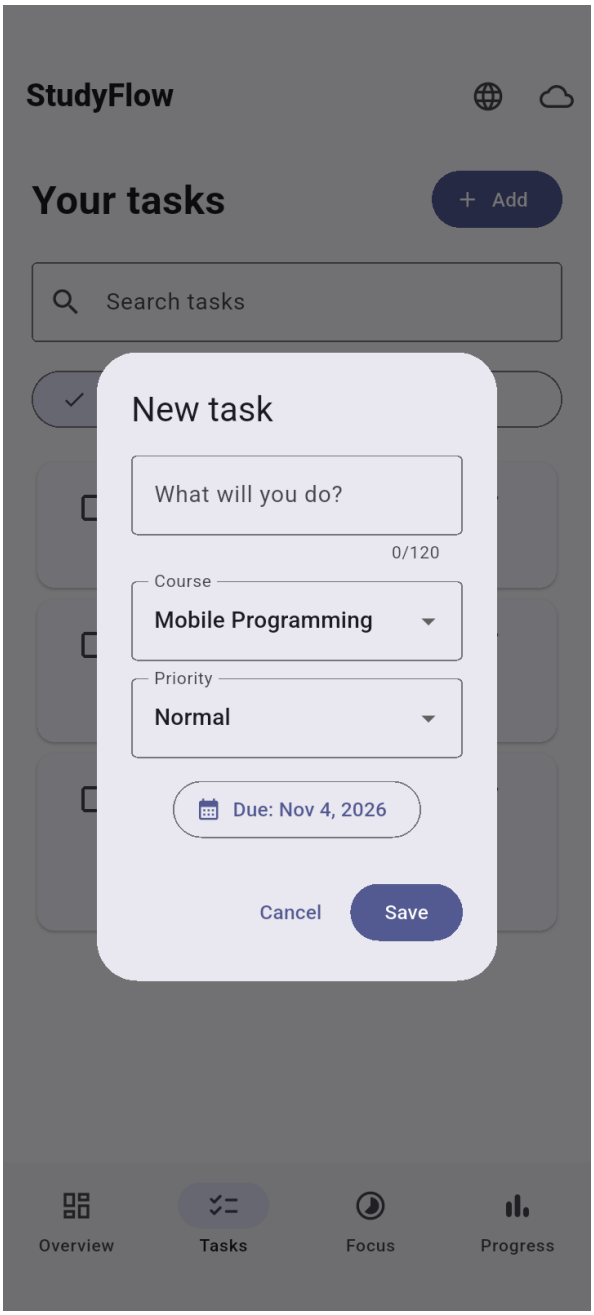

Figure 1. Overview. Figure 2. Pending tasks. The demonstration plan contains three pending tasks and one completed task.

The search field narrows the list by title. Pending, Done and All operate on the same data. A checkbox changes completion status; the trash icon deletes a record after confirmation. Scroll to reach the rest of the course list.

New task form

At least one course is required before creating a task. Add opens a dialog containing the title, course, priority and due date.

1 / Title
Empty or whitespace-only titles are rejected. Input is limited to 120 characters.

2 / Course
The task is linked to the identifier of the selected course.

3 / Priority
Low, Normal and High are available. Normal is the default.

4 / Due date
The date picker uses the selected interface language.

5 / Save or cancel
Save adds the task to the local plan. Cancel closes the dialog without creating a record.

Figure 3. New task dialog, with the keyboard dismissed so that the complete form remains visible.

Focus and progress

Focus provides a single timed study session. Progress shows the daily distribution of saved sessions and completion rates for course tasks.

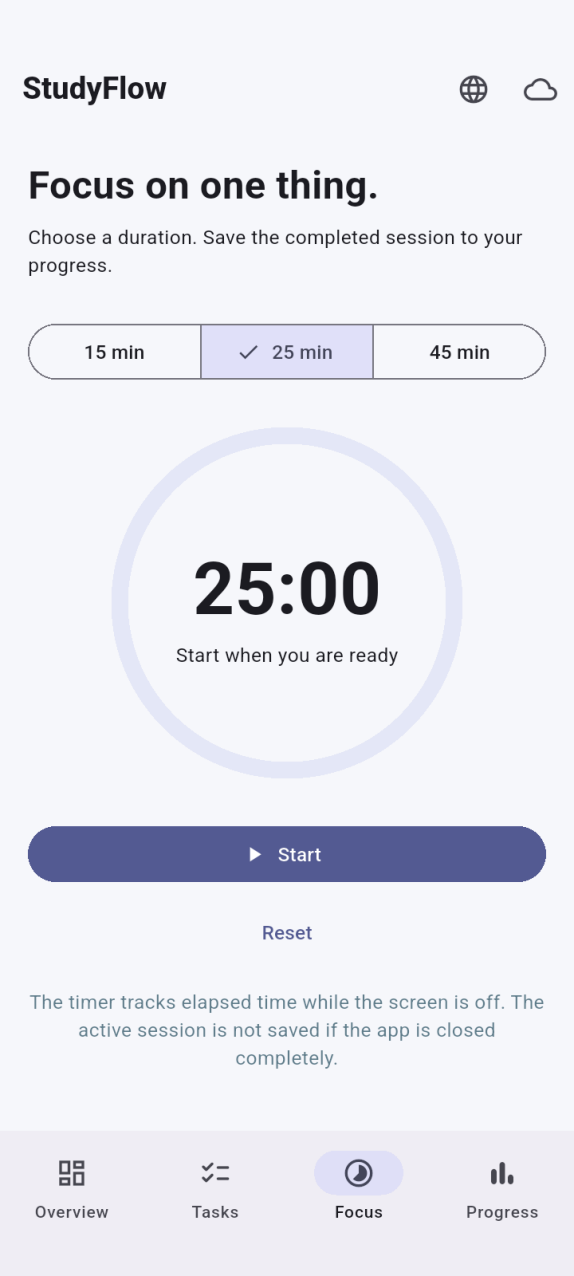

Figure 4. Timer ready for a 25-minute session. Figure 5. The demonstration plan contains 250 study minutes over seven days, alongside task completion totals.

Save session appears when the timer finishes. The session is not added to the chart until this button is pressed. Changing tabs preserves the timer; completely terminating the app discards the active timer.

Turkish and English interface

Use the language icon at the top right to select Turkish or English. Headings, forms, feedback and the date picker use the selected language. User-entered course and task names remain unchanged.

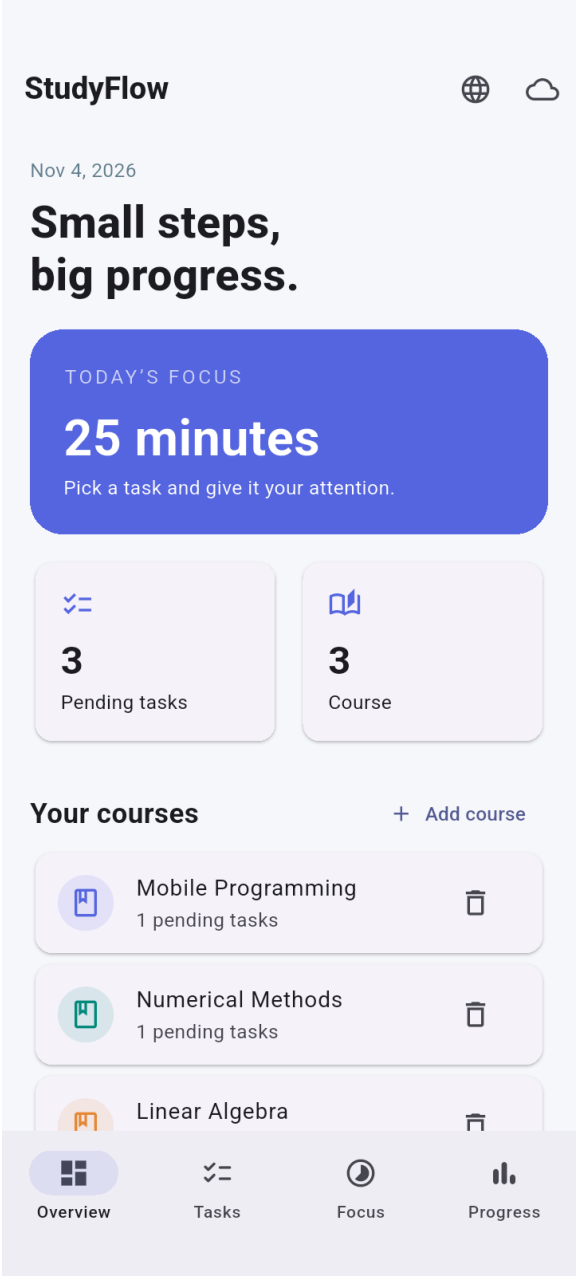

Figure 6. Language selection menu. Figure 7. English interface. In these English report captures the demonstration names are also entered in English; user data is not automatically translated.

The language preference is saved on this device. Signing in or restoring a plan backup does not change it. Persistence across reopening has been checked in both storage and interface tests.

Account and registration screens

The cloud icon opens Account and cloud. Users can sign in with an existing account or switch to registration. Password input is masked.

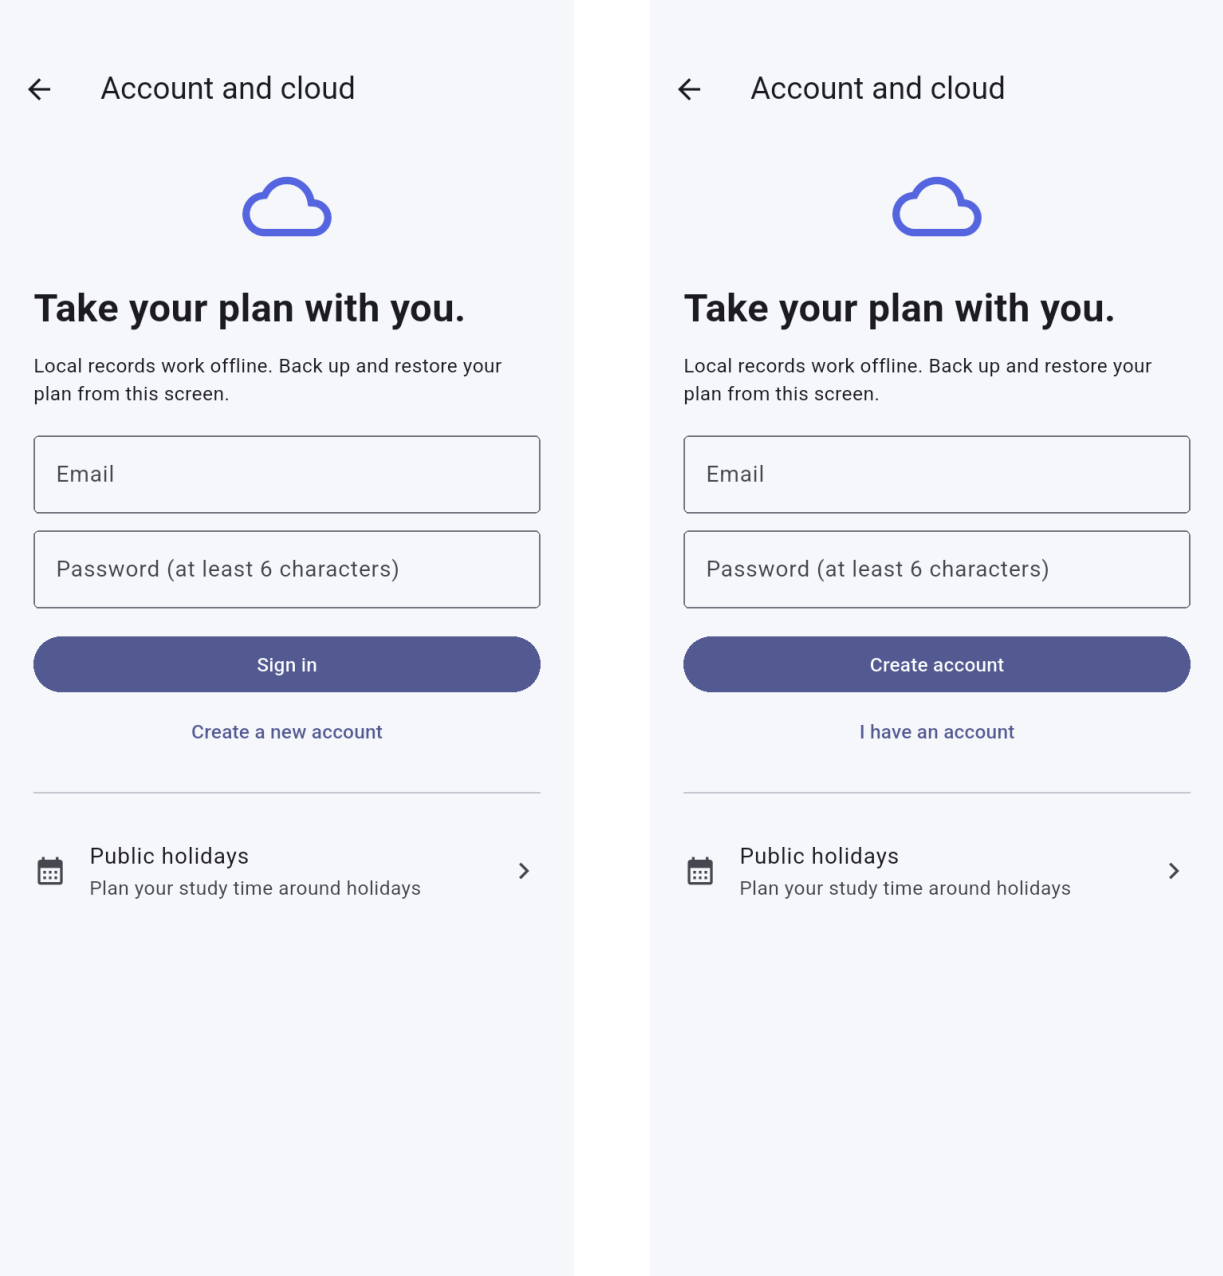

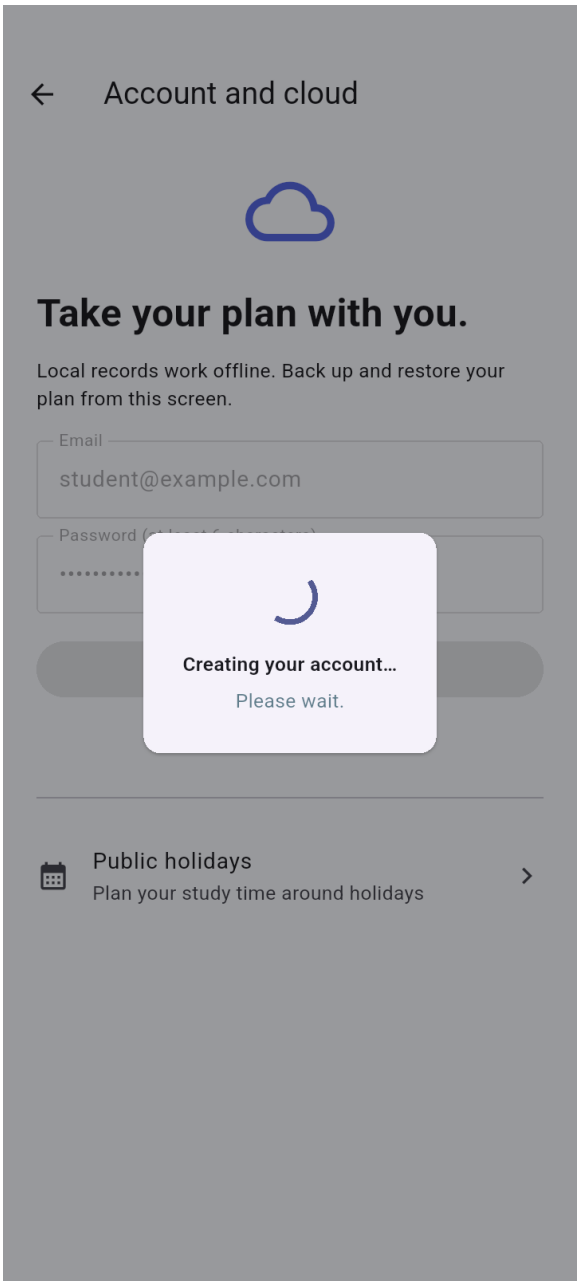

Figure 8. Sign-in view. Figure 9. Create-account view. Both are interface states captured with a controlled test service.

After sign-in, the app offers backup of this device’s plan and restoration of the server plan. A new local change stays on the device until Back up this device is performed.

Loading and error feedback

During network operations, a central indicator and operation description are displayed. Background input and back navigation are blocked. On failure, the overlay closes and the form becomes usable again.

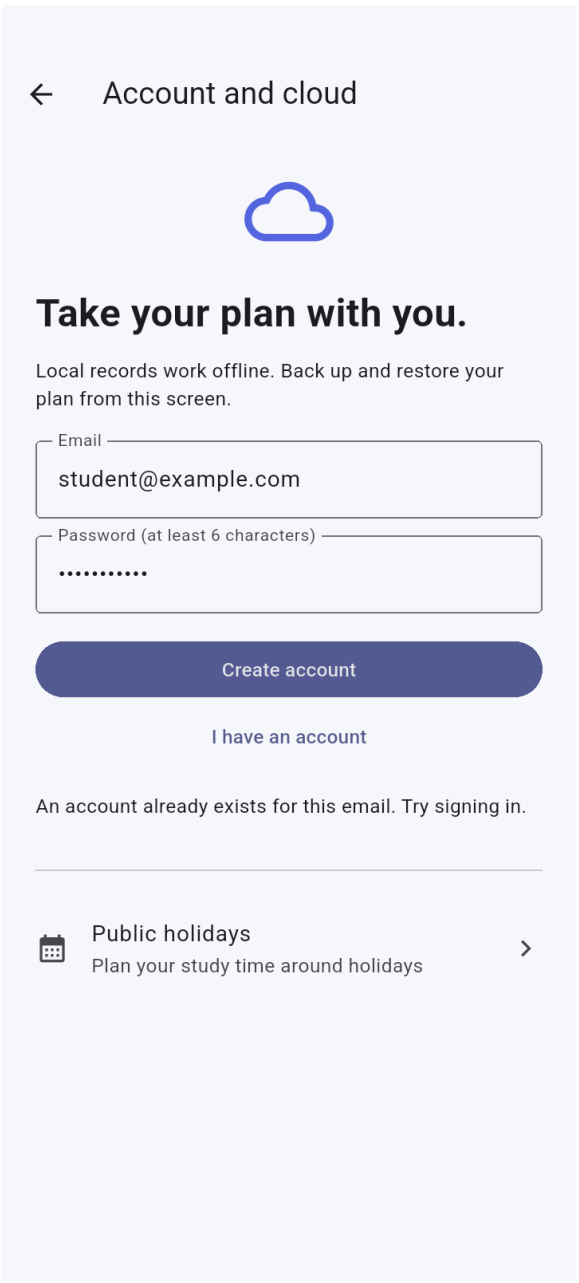

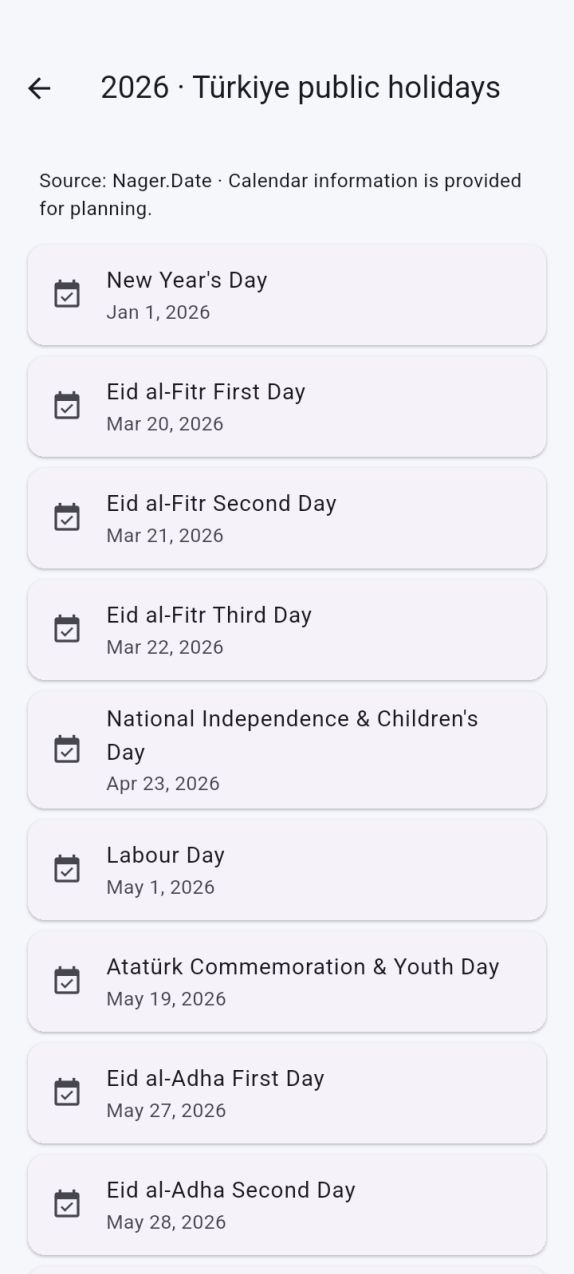

Figure 10. Loading overlay during registration. Figure 11. A helpful message for an email address already in use. These states use controlled test responses.

Error messages suggest a corrective action. For an existing email, the user is asked to sign in instead of registering again. Unexpected errors retain a diagnostic code without exposing raw server details.

Holiday calendar and example workflow

Access
Open Public holidays near the bottom of the account screen.

Data source
The current year's public holidays in Türkiye are retrieved from Nager.Date.

Language behavior
Turkish shows the local name; English shows the service's English name.

Network failure
A retry option is offered. Local courses and tasks are unaffected.

Figure 12. Holiday calendar. Entries in the list come from the online service response.

Suggested workflow

Add a course → create a task → choose a due date and priority → complete the task → save focus time → review progress → update the cloud backup when needed. This sequence connects local planning with account and backup functions.
